CASE: 1

ORAL MUCOSA MANIFESTATIONS / SIDE EFFECTS FROM THE THERAPY OF ANCHYLOSING SPONDYLITIS

The medical history of the patient with "ankylosing spondylitis".
Twenty one years old female patient. Student.
Four years ago (2009), she was diagnosed as “juvenile arthritis”.
The diagnosis was changed to "ankylosing spondylitis" in 2012.
There is a history of this disease in her family. The presence of HBL gene has also been determined.
The medicines she is using are Salazopyrin (salisilazosülfapiridin) (sülfasalazin) and Rantudil (non steroidal antiinflammatory drug).
She is suffering from painful aphteous ulcer lesions in the oral cavity, mostly in buccal mucosa and tongue in every two months, approximately 1cm² size.
She is also having other smaller painful oral wounds in every month.
She is suffering from pains during eating and speaking. The aphtous lesions are healing in 10 days.
We offered her to use the NBF gel. The lesions healed rapidly, in 3 days / the results were excellent.
The pictures which we taken from the patient. Before and after the gel.
The healing was three days after.
Actually the post treatment one is not a good photo.
But the result is obviously excellent that can be seen in the picture (in three days).
